Wir werden heute Abend ein Programm zur Verarbeitung von vielen Personendaten bauen (Vorname, Nachname, Geburtstag). Wir suchen den Tag an dem die meisten Menschen Geburtstag haben und wie viele das sind.

Rate: wie viele Sekunden brauchen wir um 100 Millionen Datensätze zu verarbeiten?

Die Eingabedatei ist eine komma-separierte Textdatei mit Fix-Breite-Spalten. Zeilen sind mit \n getrennt. Spalten sind mit ; getrennt. Es gibt kein Escaping oder Quoting. Datumswerte sind im Format 'YYYY-MM-DD'. Die Eingabedatei ist gezippt.

Hardware: AMD Ryzen 9 9950X, 64GB RAM, Windows 11, PCIe 5 SSD
